

Isbell's work as prior art  
against Mayes et al.

- 1 A I don't understand the question.  
2 (Question read by the reporter.)
- 3 A Yes.
- 4 Q Do you do any actual antenna work for JFD?
- 5 A I have.
- 6 Q In your work in the electrical engineering department  
7 at the university are you generally familiar with the  
8 work done by others in the matter of research and de-  
9 velopment in the antenna laboratory?
- 10 A Some that I have direct relationship with in a super-  
11 visory manner, I am more familiar with their work than  
12 others.
- 13 Q Is there any particular aspect of the work in the an-  
14 tenna laboratory which you are more closely associated  
15 with in that way in the sense of supervisory work,  
16 than others?
- 17 A Yes, in work on broad band and frequency independent  
18 antennas and the area of superdirective antennas.
- 19 Q I show you a copy of a patent to Dwight E. Isbell,  
20 #3210767; are you familiar with that patent?
- 21 A Yes, sir.
- 22 Q Are you familiar with the work on which that patent  
23 was based?
- 24 A Yes.

- 1 Q Were you familiar with it at the time it was going on?
- 2 A Yes. *Go to next page*
- 3 Q Are you familiar with the records that were kept on
- 4 that work as it was in progress?
- 5 A Yes.
- 6 Q Are you familiar with the practical applications of the
- 7 subject matter of this patent?
- 8 A Yes.
- 9 Q Will you state generally to what the patent relates?
- 10 A The patent describes a method of obtaining frequency
- 11 *select* independent performance of theoretically unlimited band
- 12 widths by using a number of dipole elements in a simple
- 13 linear form which are all connected to a two wire trans-
- 14 mission line which is transposed between adjacent
- 15 dipoles. The dipoles are of various lengths according
- 16 to a proposed mathematical relationship and spaces be-
- 17 *like* tween adjacent dipoles are predetermined in fashion.
- 18 Q For convenience in the course of this deposition this
- 19 patent will be referred to hereafter as Isbell Patent
- 20 767, those numbers being the last three digits of the
- 21 patent number. Are you familiar, Dr. Mayes, with the
- 22 practical applications of the subject matter of the
- 23 Isbell 767 patent to military needs?
- 24 A Yes, somewhat.

1 tory of the University of Illinois sometime prior to  
2 1959?

3 A Yes.

4 Q Do you know roughly what period of time he was associat-  
5 ed with the antenna laboratory?

6 A Roughly 1953, 1957.

7 Q Did he leave in 1957?

8 A I am not sure but it was approximately then.

9 Q In connection with your work for the antenna laboratory  
10 were you in the practice of familiarizing yourself with  
11 publications by the electrical engineering department  
12 relating to development work done in the antenna labor-  
13 atory?

14 A Would you repeat that?

15 (Question read by the reporter.)

16 Q Strike the question; I'll rephrase it. Let me start  
17 off by asking you when you became associated with the  
18 antenna laboratory at the University?

19 A September 1, 1954.

20 Q After you became associated with the antenna laboratory  
21 did you develop the practice of familiarizing yourself  
22 with publications by the electrical engineering depart-  
23 ment of the University that related to antenna develop-  
24 ment work in the antenna laboratory?

1 A The term "familiarize", I don't know if that's appropriate.  
2 Some of these reports I actually participated  
3 in the preparation of them. Others I was involved in  
4 the review process for them, and still others I had  
5 very little to do with.

6 Q When did you have occasion to participate in any review  
7 process relating to such publications; when did you begin  
8 to do this?

9 A It was roughly at the time that Dr. DuHamel left the  
10 laboratory. There may have been some incidental contributions  
11 to the review process before that time, but  
12 I didn't have major responsibility in this area until  
13 he left.

14 Q Did you acquire that responsibility about 1957?

15 A Approximately, yes.

16 Q And did you continue to have that primary responsibility  
17 for a long period thereafter?

18 A Yes.

19 Q Do you still have it?

20 A Yes, with regard to some reports, not all.

21 Q In what particular areas or classifications would the  
22 reports fall that you did have such responsibility for?

23 A These were generally generated under research contracts  
24 of which I was one of the supervisory personnel.

## Folded dipoles vs. simple dipoles

1 Q Namely the length to width ratio?

2 A Yes.

3 Q The aspect ratio would also to some degree involve the  
4 thickness of the sheet, would it not?

5 A I was presuming the thickness was thin enough it  
6 wouldn't really enter into consideration.

7 Q You are familiar also, I am sure, with what are called  
8 folded dipoles?

9 A Yes.

10 Q Might a folded dipole be described as a simple dipole  
11 of the type you first described in which the conduc-  
12 tor continues from the extreme ends of the simple  
13 dipole but being bent at each end in the same direc-  
14 <sup>and</sup>tion and around the back toward the center to form a  
15 continuous conductor from the gap out to one end,  
16 around back parallel to the simple dipole portion,  
17 out to the other end and connected to the other end,  
18 and back to the center gap?

19 A Yes.

20 Q Such folded dipoles are commonly referred to as dipoles  
21 in the art, are they not?

22 A Yes.

23 Q When used in an antenna does a folded dipole perform  
24 basically the same function as a simple dipole?

1 A Yes.

2 Q What are its principal differences in operating char-  
3      acteristics?

4 A The input impedance is approximately four times the  
5      impedance at resonance of the simple linear dipole,  
6      and this relationship, four to one ratio, is also only  
7      one of the possible of several resonances which the  
8      ~~dipole~~  
9      folded dipoles displays.

10 Q When one is concerned with an antenna of a plurality  
11      of dipoles that are connected in one way or another,  
12      one to another and to a transmission line, is it not  
13      practical to make - or has it not long been practical  
14      for many years, to make the same antenna either with  
15      simple dipoles of the type you first described or  
16      folded dipoles by making several adjustments in the  
17      connecting circuitry for differences in impedance  
18      value?

19 A I am not sure I understand the question. Do you mean  
20      is it possible to make an antenna which has been de-  
21      signed specifically to connect several simple dipoles  
22      and to replace those simple linear dipoles with folded  
23      dipoles?

24 A Yes, by making adjustments in the conductors that  
25      interconnect the dipoles and connect them to the trans-

Research reports were freely available  
& there was no policy against it  
as long as copies were available

1 produced in quantity by the antenna laboratory in the  
2 University at the time they were prepared initially.

3 A I believe about 250 copies perhaps more contained all  
4 these reports.

5 Q And were a considerable number of copies of each such  
6 report transmitted to the Air Force?

7 A Yes.

8 Q And do those reports contain distribution lists at the  
9 ends of those reports?

10 A Yes.

11 Q And were copies of the reports transmitted to the var-  
12 ious parties named in the distribution lists?

13 A I presume they were.

14 Q Do you know if that was the normal practice?

15 A This was the normal practice, yes.

16 Referring to Antenna Laboratory Research Reports

17 Q Were other copies of the same reports commonly sent to  
18 other people by you or others in the antenna laboratory?

19 A people that are not listed in the distribution lists?

20 Q Yes.

21 A Yes, in some instances subsequent to request by some  
22 people for information.

23 Q Did you commonly receive requests from outsiders for in-  
24 formation regarding the work of the antenna laboratory  
on Log periodic antennas?

1 A Yes.

2 Q And the antenna laboratory supplies of reports such as  
3 Plaintiff's Exhibits 8, 9, 10 and 11, were commonly  
4 used to fill these requests for copies?

5 A So far as they were available.

6 Q And were copies of such reports normally placed in var-  
7 ious libraries of the University?

8 A I don't believe so.

9 Q Don't you know as a fact that copies are on deposit  
10 currently in a number of libraries on the campus of the  
11 University, sir?

12 A I don't know that, no.

13 Q You don't know that? Were copies of such reports freely  
14 supplied to interested parties who wrote and asked for  
15 them as long as there was a supply?

16 A Not in all instances, no.

17 Q Was there any particular restrictive policy in that re-  
18 gard?

19 A There was not any very well defined policy, but in some  
20 instances reports were not supplied even though re-  
21 quested.

22 Q For what reasons would they not be supplied?

23 A In instances where it was considered that the organiza-  
24 tion had no research facilities or production facilities

1 or any personnel that could have made use of the infor-  
2 mation. In some instances the reports were of limited  
3 supply and it was felt it was best to conserve the sup-  
4 ply for the people who would make best use of the in-  
5 formation.

6 \* The objective of the restriction was insofar as was  
7 possible to see that the available supply went to the  
8 people most genuinely and seriously interested in the  
9 subject matter?

10 A Yes.

11 Go to next page

12 Q Two of those reports, Plaintiff's Exhibits 8 and 9, are  
13 entitled Quarterly Engineering Reports and two are enti-  
14 tled Technical Reports; could you explain the differ-  
15 ence in the classification and the reason for it?

16 A Quarterly Engineering Reports are issued periodically  
17 and are brief summaries which contain information about  
18 all of the work that has been done on the contract dur-  
19 ing a quarterly period of time.

20 Q On the contracts to which the reports pertain?

21 A Right. The technical reports are issued as material of  
22 a specific reportable nature is obtained and there is  
23 no definite scheduling for the technical reports.

24 Q Do you know if the preparation of the technical reports  
was required by the contracts to which they refer or was

1 someone trying to make use of them in their work or  
2 some of the work we have done.

3 Q This was not because of any policy of limiting the dis-  
4 tribution, but rather of supplying the most logical in-  
5 formation?

6 A Yes.

7 Q If a party having a legitimate reason for wanting a  
8 quarterly engineering report asked for one and you had  
9 available copies, he would be given one?

10 A In general we would honor such a request except as we  
11 are restricted by the Air Force, like overseas distribu-  
12 tion and things like that.

13 Q But those terms don't apply to distribution within the  
14 United States?

15 A No.

16 Q In your deposition in the Isbell interference when asked  
17 about the frequency with which reports were issued by  
18 the antenna laboratory, you stated, "The so-called  
19 quarterly engineering reports were prepared of course  
20 every three months. There were more frequent reports  
21 of a more ~~fundamental~~ nature than were prepared monthly."  
22 What were these monthly reports and for what purpose  
23 were they prepared and how were they handled?  
24 A Monthly reports or letter reports, they are not pub-

## Turner's suggestion of Veering

of January 17, 1967.)

Q I would like to have the reporter mark for identification as Plaintiff's Exhibit 14 a three page document headed, University of Illinois Disclosure of Invention, and letter of transmittal, the pages being stamped by counsel with page numbers 5109 to 5111 inclusive.

(Plaintiff's Exhibit 14 marked for identification  
as of January 17, 1967.)

Dr. Mayes, are you familiar with the document identified as Plaintiff's Exhibit 142

A yes, sir.

Q Does that document provide a record of the development of the subject matter of the Hayes, et al. Re-issue patent and the original Hayes, et al. patent 3106280?

A Yes.

I'll ask the reporter to identify as plaintiff's Exhibit 15 a two page document headed Office of Naval Research, and in the upper lefthand corner, Record of Invention, the pages of this document being stamped by counsel as 5278 and 5279.

(Plaintiff's Exhibit 15 marked for identification  
as of January 17, 1967.)

Dr. Mayes, are you familiar with the document, plain-

1 Plaintiff's Exhibit 15?

2 Yes.

3 Q And do you recognize the signature of Robert E. Gar-  
4 rrol as being his signature?

5 Yes.

6 Q Referring to Plaintiff's Exhibit 15, in Item 9 of the  
7 printed form in the middle of the first page, it is  
8 stated, "On June 11, 1969, Mr. H. M. Turner of Wright  
9 Air Development Center asked if the angle of dipoles  
10 on a log-periodic dipole array had been used as a de-  
11 sign parameter. This was tried with no significant  
12 change in performance. The idea of operating at  
13 higher frequencies so that a change would be obtained  
14 then led to the present invention."

15 Did that question asked by Mr. Turner as indicated  
16 in the above come to your orally?

17 A Yes.

18 Q From him personally?

19 A Yes.

20 Q And did this occur at a meeting between you and Mr.  
21 Turner here in the antenna laboratory?

22 A Yes.

23 Q On the date June 11, 1969?

24 A According to the record.

1 Q This was your best knowledge of that date at the time  
2 you signed Plaintiff's Exhibit 15?

3 A Yes.

4 Q Did you have any record of your own from which you may  
5 have fixed the date, do you know?

6 A I don't remember whether there was any record or not.

7 Q In any event, is it your clear recollection that the  
8 sequence of events stated in that part I quoted above  
9 is correct?

10 A Yes.

11 Q Do you recall the exact substance of the question  
12 asked by Mr. Turner with regard to using the angle of  
13 dipoles as a design parameter?

14 A No, not any more than what's stated in this.

15 Q Would you agree [with what I learned from Mr. Turner]  
16 that in asking that question he was referring to moving  
17 the dipole arms of the simple dipoles in antennas of  
18 the type disclosed in the Isbell 767 patent, forwardly  
19 so that they would be in effect a V-dipole?

20 A This was our understanding of his question, yes.

21 Q Did he ask in connection with the asking of that ques-  
22 tion that a suitable included angle between the two  
23 dipole halves would be 120 degrees?

24 A I don't recall that any figure was mentioned for the

1 angle at all.

2 Q Or that the angle that the dipoles would be swung  
3 forwardly through would be thirty degrees on either  
4 side?

5 A I don't recall that he made any mention of any angle  
6 at all.

7 Q Did you understand at the time that his suggestion had  
8 reference only to operation of the antenna on the fun-  
9 damental one-half wave mode?

10 A Yes.

11 Q Didn't you previously testify that it would not be ex-  
12 pected that such a change in the dipoles would improve  
13 the gain of the antenna on the one-half wave mode?

14 A I did.

Go to next pg.

15 Q And prior to June 11, 1959, wouldn't it have been ap-  
16 parent to anyone familiar with v-dipoles and their  
17 operation that this would not improve the gain on the  
18 one-half wave mode operation?

19 A I think so.

20 Q One reason being as given frequently in the literature  
21 in this field that the effective aperture of the an-  
22 tenna is reduced by v'ing the elements forwardly, is  
23 that correct?

24 A Yes.

1 Q But nevertheless, I gather from this quoted statement  
2 you tested such an antenna after tying the elements  
3 forwardly on the one-half wave fundamental mode and  
4 verified there was no significant difference?

5 A That's right.

6 Q In any event you verified, I assume, there was no im-  
7 provement in gain?

8 A That's right. But it still worked

9 Q Or in radiation pattern?

10 A There was a broadening of the beam.

11 Q Which was, for purposes of a unidirectional antenna,  
12 a deteriorating effect if the beam were broadened.

13 A It would have no application.

14 Q It would be less directional?

15 A Yes.

16 Q And then you took the same antenna you had modified  
17 in accordance with the suggestion of his question  
18 and tested it on a higher mode or higher modes?

19 A I don't recall if it was the same antenna or not.

20 Q A similar antenna?

21 A Similar antennas, yes.

22 Q Then you tested that similar antenna on higher modes,  
23 and what did you learn from that?

24 A Our first tests were, as usual in new areas like this,

1  
2 rather nonconclusive, but at the same time we began  
3 to run into the matter of the operation of a single  
4 v-dipole and by comparing some of the references of  
5 previous literature with experimental data obtained,  
6 we were able to change the parameter of the antenna  
7 in such a fashion as to obtain an operation which we  
8 thought would be useful.

What parameters - V-angle

9 Q In doing this was it necessary to depart from any of  
10 the principles disclosed in the Isbell 767 patent with  
11 reference to the dipole lengths and spacings?

12 A Yes.

13 Q In what respects were departures required?

14 A The spacings that were permissible in terms of wave  
15 lengths for the Isbell fundamental mode operation were  
16 not permissible in all cases for the higher mode op-  
eration of the v-dipole antenna.

17 Q Does Isbell 767 patent to your knowledge disclose how  
18 to select particular values for those parameters other  
19 than by cut and try with the principles of using the  
20 log periodic formula?

21 A I am not sure about the patent. I can say some of the  
22 parameters that had been successfully applied to Is-  
23 bell's antenna could not be successfully applied to the  
24 v-dipole.

1           compared to corresponding simple dipoles, was it not?

2           A Yes.

3           Q And such characteristics of V-dipoles compared to  
4           simple dipoles were well known prior to June of 1959?

5           A Yes.

6           Q Do you know if there is anything in the Mayes, et al.  
7           Re-issue Patent or the original patent on which it  
8           was based to suggest any departure in the design  
9           parameters from those which would be required for an  
10          antenna constructed under the Isbell 767 patent?

11          A Well, certainly the change in angle with respect to  
12          the V-dipoles as compared to the Isbell Patent.

13          Q Is there any suggestion that there would be a differ-  
14          ence in the selection of the appropriate spacings for  
15          the V-dipole array than for the straight dipole array  
16          of the Isbell 767 patent?

17          A I couldn't say whether that is covered in the patent  
18          itself; I don't remember.

19          Q And when you tested the V-dipole type of array shown  
20          in the Mayes, et al. Re-issue patent, you did find  
21          the increased gain and sharper directivity on the  
22          higher modes as expected, as compared to the direc-  
23          tivity and gain of the straight dipoles of the Isbell  
24          767 patent?

1 A. With appropriate design parameters.

2 Q. Do you know if there is anything in the disclosure of  
3 the Hayes, et al. re-issue patent or the prior origi-  
4 nal patent on which it was based, that would indicate  
5 the desirability or feasibility of departing from the  
6 log periodic formula shown in column 2 of those patents  
7 at Line 25, either as regards the constancy of the  
8  $\tan$  values for lengths or the constancy of the  $\tan$  val-  
9 ues for spacings or applying different  $\tan$  values for  
10 lengths and spacings?

11 A. Was your question with regard to the entire patent or  
12 some portion of the patent?

13 Q. Anything in the disclosure of the patent which would  
14 suggest any such particularities for the log periodic given  
15 in the patent.  
16 A. I don't recall any such suggestions.

17 Q. In Column 2 beginning at Line 44 of the Hayes, et al.,  
18 re-issue patent, and in the corresponding portion of  
19 the original patent on which it was based, this is  
20 stated: "The angle formed by the arms of a v-element is  
21 designated as  $\Psi$ . It will be seen that when the angle  
22  $\Psi$  is equal to 180°, the antennas of the invention are  
23 identical with those described by Rebell in the appli-  
24 cation mentioned above. In the instant invention, how-
